KHANMART ELECTRONICS STORE

Website Features, Development Process and How the Web Page Works

Project type Static electronics storefront prototype	**Technologies** HTML5 and CSS3
Content Laptops, smartphones, accessories and smart devices	**Purpose** Demonstrate product browsing and smartphone comparison

This document is based on the HTML and CSS source code supplied for the KhanMart electronics storefront. It explains the page's visible features, the role of the main code sections, how visitors navigate the page, and which interactions are currently only visual placeholders.

PROJECT DOCUMENTATION • 2026

1. Project Overview

KhanMart is a sample electronics shopping page. The header uses the brand label “KhanMart,” while the browser title is “khan Electronics.” The page groups example products into Laptops, Smartphones, Accessories and Smart Devices, then provides a comparison table for two smartphones.

The design uses a dark navy background for the main navigation and table headings, a light grey-blue page background, white product cards, and yellow hover states. The layout is intended to make product information easy to scan and compare.

2. Main Features

Feature	Description
Brand navigation bar	Shows the KhanMart name and placeholder links for Sign in and Cart (2).

Category filter-style links	Pill-shaped links jump to Laptops, Smartphones, Accessories, Smart Devices or Compare sections.
Sale banner	Highlights “Upgrade sale: up to 39% off” and free delivery on all orders.
Product cards	Displays six product cards across four categories, with a product emoji, product name, short specification, rating, current price and View details link.
Discount badges	Red labels display sample discounts such as -16%, -18%, -39% and -35%.
Price comparison	Old prices are shown with a line through them to distinguish them from current displayed prices.
Ratings	Star symbols and numeric ratings give each product a visual review summary.
Smartphone comparison table	Compares Pixelo X5 and Nova S Ultra by price, display, camera, RAM/storage, battery and rating.
Hover effects	Product cards move up slightly when hovered; category links and buttons change colors.
Responsive product grid	CSS Grid creates columns that adapt to the available width.
Footer	Displays a copyright line and identifies the page as a sample store for learning.

3. Products Included

Category	Product	Displayed price
Laptops	Zenith Air 14	■58,990 (was ■69,990)
Smartphones	Pixelo X5	■32,999 (was ■39,999)
Smartphones	Nova S Ultra	■74,999 (was ■84,999)
Accessories	Pixelo Buds Pro	■4,299 (was ■6,999)
Smart Devices	Pixelo Watch 2	■6,499 (was ■9,999)

Smartphone comparison data

Feature	Pixelo X5	Nova S Ultra
Price	■32,999	■74,999
Display	6.7-inch OLED	6.8-inch OLED
Camera	50 MP	200 MP

RAM / Storage	8 GB / 256 GB	12 GB / 512 GB
Battery	5000 mAh	5000 mAh
Rating	4.5	4.6

Note: the specifications and prices above are reproduced from the supplied example code. They are sample storefront content, not independently verified product listings.

4. Technologies Used

HTML5 — page structure

HTML defines the content: headings, paragraphs, links, product cards, the category sections and the smartphone comparison table. The document begins with the HTML5 doctype and includes metadata for character encoding and viewport sizing.

CSS3 — visual design and layout

CSS is placed inside the <style> element in the page head. It controls the navy-and-yellow color theme, spacing, fonts, card shapes, shadows, hover states, grid layout and table styling.

No JavaScript or back-end is present in the supplied code

The supplied page contains HTML and CSS only. It does not include JavaScript, a server, a product database, authentication, cart logic or payment processing. Therefore, the page is a static front-end demonstration rather than a complete e-commerce application.

5. How the Web Page Was Created

Step 1 — Create the HTML document

Add the doctype, language, character encoding, responsive viewport and page title.

Step 2 — Define the global design

Use the universal selector to reset margins and padding and set box-sizing. Set the page font, background and text color.

Step 3 — Build the navigation bar

Create the KhanMart logo area and add Sign in and Cart (2) links inside a centered container.

Step 4 — Add category navigation

Create pill-style links and connect each link to a section ID such as #laptops or #phones.

Step 5 — Add the sale banner

Display the sale headline and free-delivery message in a navy banner.

Step 6 — Build product sections

Create headings and product cards for laptops, smartphones, accessories and smart devices.

Step 7 — Add product details

Include example specifications, star ratings, current and old prices, discount badges and View details links.

Step 8 — Create the comparison table

Use table rows and columns to compare the two smartphone examples across six attributes.

Step 9 — Add the footer and test

Finish with the footer, save the file with an .html extension and open it in a browser to inspect the layout and links.

6. How the Web Page Works

When a visitor opens the HTML file

The browser parses the HTML and creates the page elements. It then applies the CSS rules to determine how the elements look and how they are arranged. Product names, specifications, ratings and prices are written directly in the HTML, so the browser displays those fixed values each time the file loads.

How navigation links work

Each category link uses a fragment URL such as href="#phones". The matching section heading has id="phones". When clicked, the browser scrolls to that heading. This built-in anchor navigation does not require JavaScript. The Compare link similarly jumps to the smartphone comparison table section.

How the product grid adapts

The .grid class uses CSS Grid with repeat(auto-fit, minmax(220px, 1fr)). The browser fits as many columns as the available space permits, while each column aims to be at least 220 pixels wide. The container has a maximum width of 1000 pixels and is centered on the page.

How the hover effects work

CSS :hover rules change the appearance when the pointer is over a category link or button. The .card:hover rule applies transform: translateY(-4px), moving the product card upward by four pixels. These effects are visual and do not change product data.

Current interaction behaviour

Element	What it currently does
Category links	Jump to the matching section on the same page; they do not filter or hide products.
Sign in and Cart (2)	Use placeholder links (href="#"); no account or cart page is implemented.
View details buttons	Use href="#" and do not open a product details page.
Comparison table	Displays static comparison information; it does not calculate or update values.
Hover states	Change styling only; they do not trigger shopping actions.

7. Important CSS Techniques

- **Universal selector (*):** Resets margins and padding and applies border-box sizing.
- **.container:** Centers content and limits the page content width to 1000 pixels.
- **Flexbox:** Arranges the navigation items and allows wrapping on narrower screens.
- **CSS Grid:** Creates a responsive multi-column layout for product cards.
- **Rounded corners and shadows:** Give cards, buttons, banners and the table wrapper a defined visual shape.

- **:hover and transform:** Add interactive visual feedback when a visitor points at an element.
- **nth-child(even):** Applies an alternate background to even table rows, improving readability.
- **overflow-x: auto:** Allows the comparison table wrapper to scroll horizontally if it is wider than its available space.

Example of the responsive grid rule:

```
grid-template-columns: repeat(auto-fit, minmax(220px, 1fr));
```

8. Limitations and Future Improvements

The following are potential future enhancements. They are not included in the supplied code.

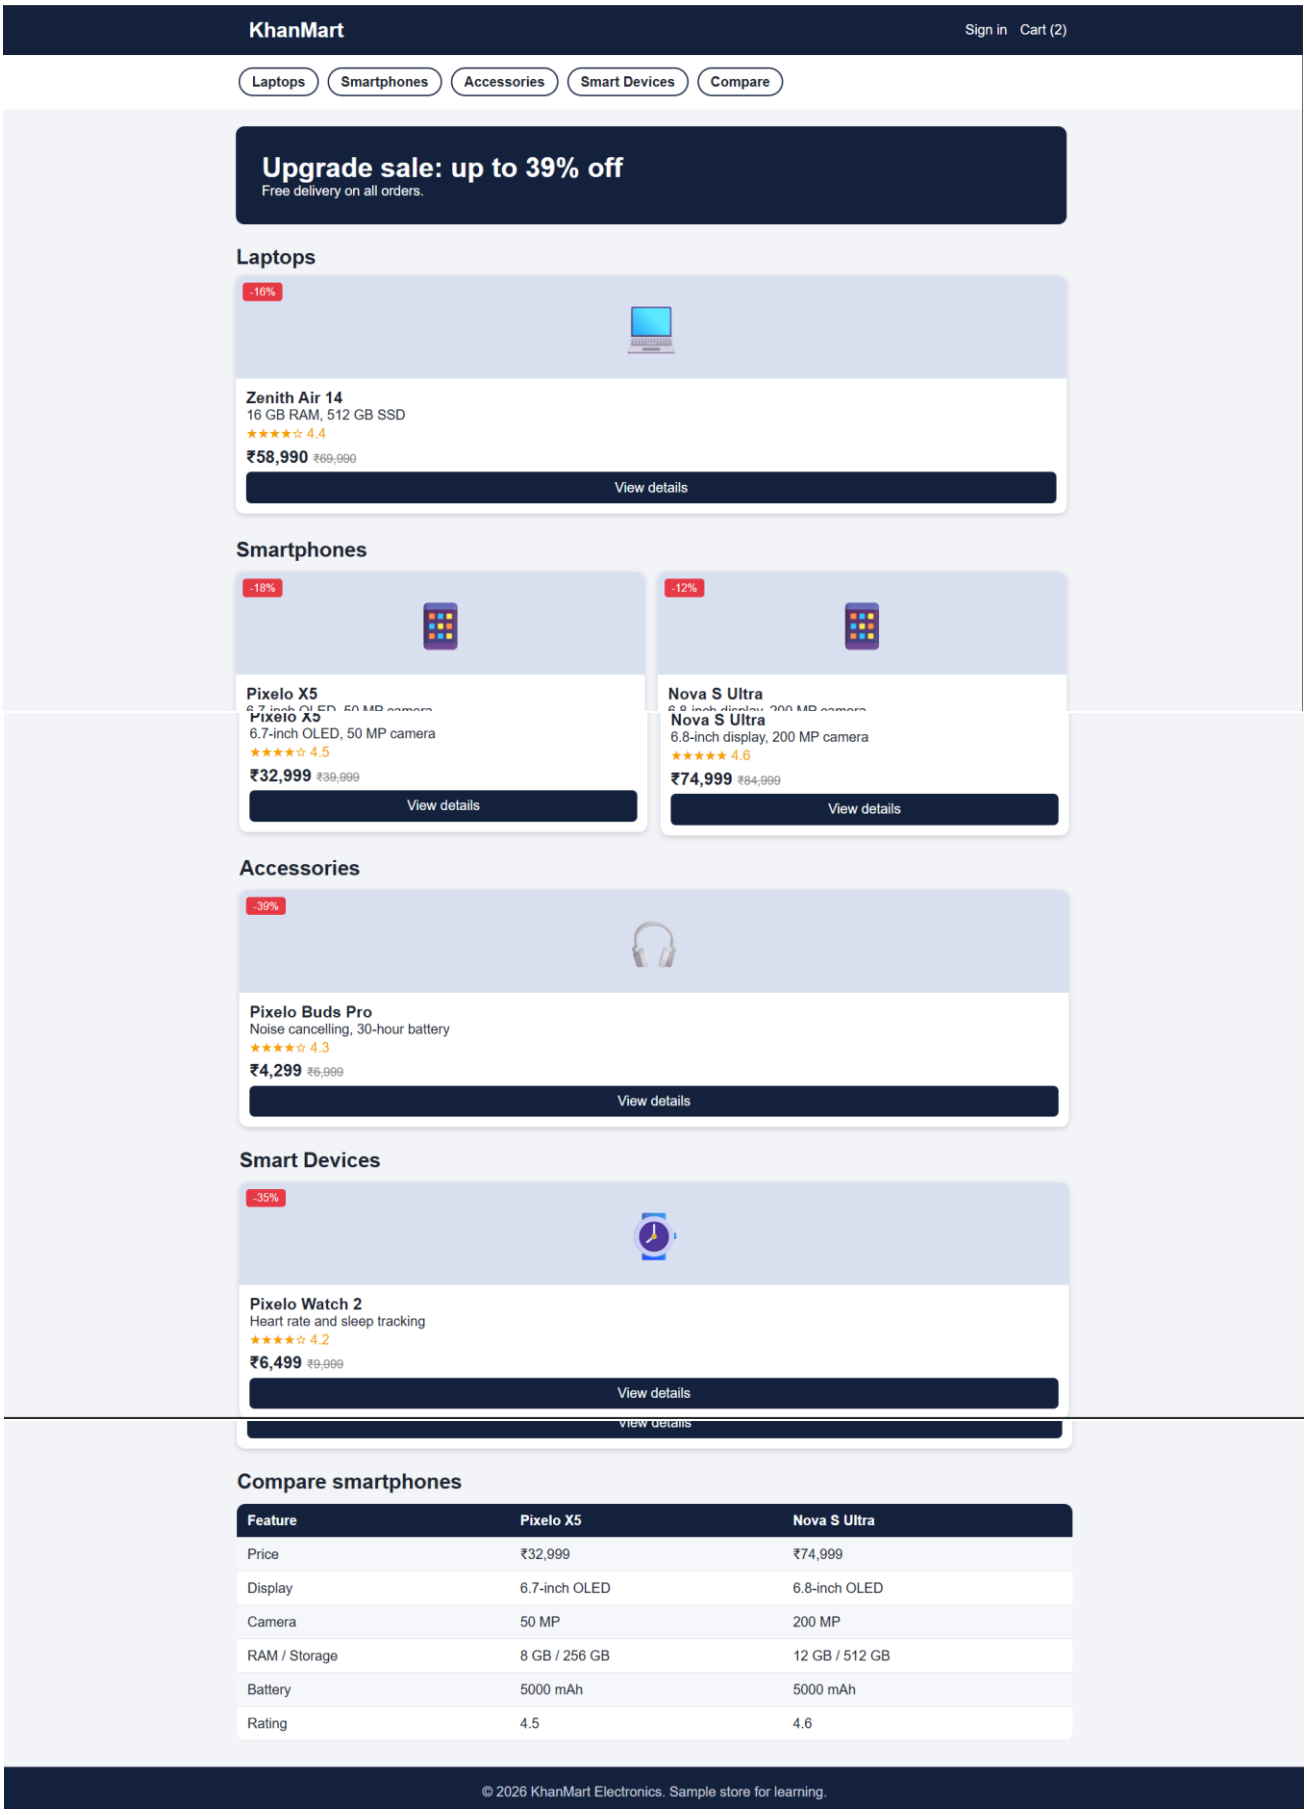

- **Functional cart:** Add JavaScript to manage cart items, quantities and totals, and use suitable storage or a back-end for persistence.
- **Working sign-in:** Add a real authentication flow and secure server-side handling.
- **Product details:** Replace placeholder links with dedicated product pages or detail panels.
- **Search and filtering:** Add a search field and category filters that update the displayed products.
- **Real product images:** Replace emoji symbols with product photographs and meaningful alt text.
- **Checkout and payments:** Integrate a trusted payment provider and secure server-side order processing.
- **Accessibility:** Add visible keyboard focus, accessible labels, semantic page landmarks and test color contrast.
- **Testing:** Check keyboard navigation and layouts on mobile, tablet and desktop screens.

9. Conclusion

KhanMart Electronics is a static electronics storefront prototype built with HTML and CSS. Its key features are category-based page navigation, product cards, discount and price displays, star ratings, hover styling, a responsive grid and a smartphone comparison table. It demonstrates how a shopping page can be structured and styled. To become a fully functional online store, it would need working application logic and secure back-end services.

Source note: This report is based on the HTML/CSS code supplied in the conversation. Product details and prices are treated as sample content, and functionality is described only where supported by the code.
