KHAN BAKERY Sweet Crumbs Website

Website Features, Development Process and How the Web Page Works

Project type Static bakery storefront website	**Technologies** HTML5 and CSS3
Product sections Cakes, pastries, cookies and custom cakes	**Additional content** Seasonal offers and contact information

Prepared from the HTML and CSS source code supplied for the Khan Bakery website. This guide explains the visible features, the development structure, how visitors navigate the page, and which actions are currently visual demonstrations rather than real ordering functions.

PROJECT DOCUMENTATION • 2026

1. Project Overview

The supplied page is a bakery storefront with the browser title “Sweet Crumbs Bakery” and the visible brand name “Khan Bakery.” It presents cakes, pastries, cookies, custom cake styles and seasonal offers, followed by a contact section.

The design uses a warm bakery-inspired palette: cream background, dark brown navigation and contact sections, soft pink hero area, and berry-pink buttons. Georgia is used as the main font to create a traditional bakery feel, while some button and product text uses Arial for clarity.

2. Main Website Features

Feature	Description
Navigation bar	Shows the Khan Bakery brand and links to Cakes, Pastries, Cookies, Custom and Contact.

Hero section	Promotes freshly baked goods and includes an “Order a custom cake” link.
Cakes section	Lists three 1 kg cakes with names and prices.
Pastries section	Lists three individual pastries with per-piece prices.
Cookies section	Lists three cookie varieties, each priced for a box of six.
Custom cake designs	Displays Birthday, Wedding, Kids’ theme and Anniversary styles. The page states that prices start from ■1,200.
Seasonal offers	Promotes a festive box with 20% off and free delivery on cake orders above ■1,000 within 5 km.
Contact section	Shows the supplied address in Guntur, opening hours, phone number and email.
Product tiles	Use emoji illustrations, colored backgrounds, rounded corners and shadows to represent bakery products.
Hover effects	Navigation links and buttons change color; product tiles move slightly upward on hover.
Responsive layout	CSS Grid and Flexbox allow product and offer sections to wrap according to available screen width.

3. Products and Prices

Section	Product	Displayed price
Cakes (1 kg)	Strawberry Cream	■850
Cakes (1 kg)	Chocolate Truffle	■950
Cakes (1 kg)	Pineapple Delight	■750
Pastries (each)	Butter Croissant	■80
Pastries (each)	Vanilla Cupcake	■70
Pastries (each)	Apple Pie Slice	■110
Cookies (box of 6)	Choco Chip	■220
Cookies (box of 6)	Butter Cookies	■180
Cookies (box of 6)	Double Chocolate	■240

Custom cake designs shown: Birthday, Wedding, Kids’ theme and Anniversary. The code gives a starting price of ■1,200 for custom cake designs. Seasonal offers are also displayed below this section.

4. Technologies Used

HTML5 — structure and content

HTML defines the navigation, hero banner, headings, product tiles, offer cards and contact details. Each main section has an id, such as cakes, pastries, cookies, custom or contact, so navigation links can jump to it.

CSS3 — visual design and layout

CSS is included in the <style> block in the document head. It controls the page colors, font choices, spacing, rounded corners, shadows, product grid, offer layout and hover effects.

No JavaScript or back-end is included

The supplied code contains HTML and CSS only. It does not include a working order form, cart, payment service, database, booking system or email/phone integration. The custom cake button is a navigation link, not an order submission feature.

5. How the Web Page Was Created

Step 1 — Set up the HTML document

Add the HTML5 doctype, English language, character encoding, viewport metadata and page title.

Step 2 — Set the global styles

Reset margins and padding, use border-box sizing, set Georgia as the main font, and choose the cream background and dark brown text.

Step 3 — Build the navigation bar

Create the brand link and navigation links for each main bakery section.

Step 4 — Create the hero area

Add the headline, short bakery description and button linking to custom cake designs.

Step 5 — Add product sections

Use headings and grids to group cakes, pastries and cookies. Each product tile contains an emoji, name and price.

Step 6 — Add custom cake styles

Create a gallery-like grid for Birthday, Wedding, Kids' theme and Anniversary cake designs.

Step 7 — Add seasonal offers

Use Flexbox offer cards to display the festive discount and delivery offer.

Step 8 — Add contact details

Create the final dark contact panel with address, opening hours, phone and email.

Step 9 — Save and test

Save the code as an .html file and open it in a browser. Test the navigation anchors, resize the browser and inspect the hover effects.

6. How the Web Page Works

When the page loads

The browser reads the HTML and creates the page structure. It then applies the CSS rules to style the elements and arrange them on screen. Product names, prices, offer text and contact details are written directly into the HTML, so they remain fixed unless the source code is edited.

How the navigation links work

A link such as href="#cakes" targets the element whose id is "cakes". Clicking Cakes makes the browser jump to that section. The same mechanism is used for Pastries, Cookies, Custom and Contact. This is built-in HTML anchor navigation and does not require JavaScript.

How product grids and offers adapt

The .grid class uses CSS Grid with repeat(auto-fit, minmax(200px, 1fr)). This lets the browser fit as many columns as possible while keeping each column around 200 pixels wide or more when space allows. The .offers and navigation areas use Flexbox with wrapping, allowing items to move onto another line when the viewport is narrower.

How hover effects work

The :hover rules change navigation and button colors when the pointer is over them. The .tile:hover rule applies transform: translateY(-5px), moving a product tile upward by five pixels. These are visual effects and do not submit an order or change product data.

Current behaviour and limitations

Element	What it currently does
Cakes / Pastries / Cookies / Custom / Contact	Scrolls to the matching section through an HTML anchor.
Order a custom cake	Jumps to the custom cake designs section; it does not submit a request.
Product tiles	Display static product names and prices; no product selection or purchase action is coded.
Seasonal offers	Display promotional messages only; no coupon validation or delivery calculation occurs.
Phone and email text	Displayed as text; they are not wrapped in telephone or email links.

7. Important CSS Techniques

- **Universal selector (*):** Resets default margin and padding and uses border-box sizing.
- **.container:** Centers the main content and limits it to 1000 pixels wide.
- **Flexbox:** Arranges the navigation and seasonal offer cards and allows wrapping.
- **CSS Grid:** Creates responsive columns for product tiles and custom cake styles.
- **:hover and transform:** Add visual feedback when the visitor points at links, buttons or tiles.
- **border-radius and box-shadow:** Create rounded product cards and subtle depth.
- **Inline background colors:** Give individual emoji product illustrations their own pastel-colored tile backgrounds.

Example responsive grid rule:

```
grid-template-columns: repeat(auto-fit, minmax(200px, 1fr));
```

8. Possible Future Improvements

The following features could be added in a future version. They are not implemented in the current source code.

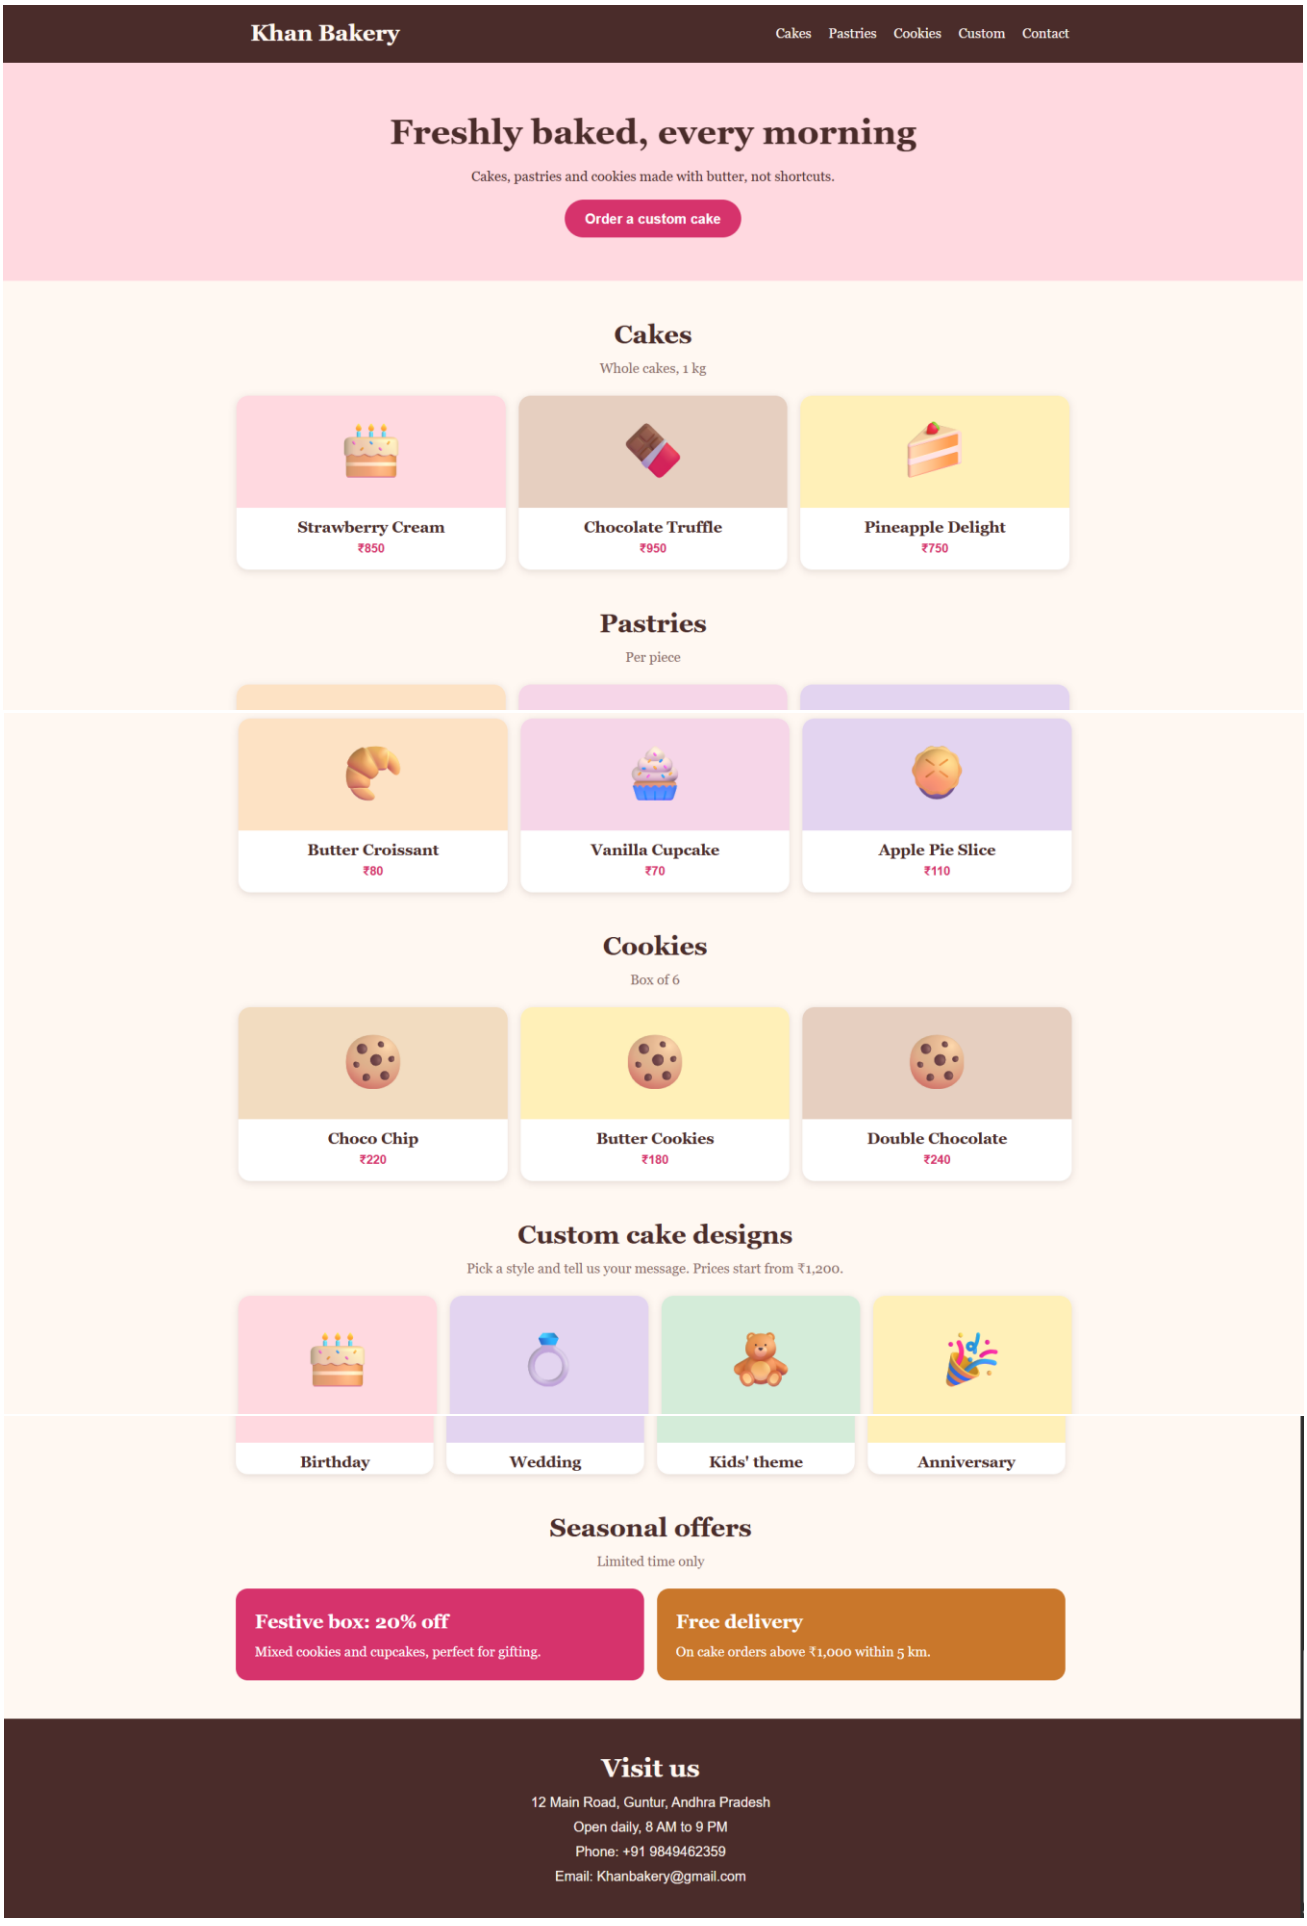

- **Custom cake order form:** Collect cake size, flavor, design, message, date and customer contact details.
- **Working order/contact links:** Make the phone number clickable with a tel: link and email clickable with a mailto: link.
- **Cart and checkout:** Add order state and integrate a secure server-side checkout and payment provider.
- **Real product photos:** Replace emoji symbols with images and meaningful alt text.
- **Dynamic menu and pricing:** Store product information in a structured data source or back-end so updates are easier.
- **Accessibility:** Add visible keyboard focus, semantic landmarks, and check text/background contrast.
- **Responsive testing:** Test on mobile, tablet and desktop widths and verify that all navigation remains usable.

9. Conclusion

The Khan Bakery website is a static bakery storefront prototype created with HTML and CSS. It presents a clear menu of cakes, pastries, cookies and custom cake styles, promotes seasonal offers, and provides contact information. Its responsive grids, warm color palette and simple section links make it easy to browse. To accept real orders, it would need additional form handling, order management and suitable back-end services.

Source note: This guide is based on the HTML and CSS code supplied in the conversation. All product details, prices, promotions and contact details are described as shown in that source.

Output:
